## Hydrolysis:

Biodegradation: 100% degraded by activated sludge in 47 h cycle (Monsanto Co. 1972)

$k = 109 \text{ yr}^{-1}$  in the water column and  $k = 1090 \text{ yr}^{-1}$  in the sediment, microbial degradation pseudo first-order rate constant (Wong & Kaiser 1975; selected, Neely 1981)

$k = 9.3 - 9.8 \text{ nmol L}^{-1} \text{ d}^{-1}$  with an initial biphenyl concentration of 4.4–4.7  $\mu\text{mol/L}$ , and  $k = 3.2 \text{ nmol L}^{-1} \text{ d}^{-1}$  with initial concentration of 2.9  $\mu\text{mol/L}$ , rate of biodegradation in water from Port Valdez (estimated, Reichardt et al. 1981)

$t_{1/2} = 1.5$  d, estimated by using water die-away test (Bailey et al. 1983)

$t_{1/2}(\text{aq. aerobic}) = 36 - 168$  h, based on river die-away test data and activated sludge screening test data (Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 144 - 672$  h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

removal rate of 5.3 and 0.52 mg (g of volatile suspended solid d)<sup>-1</sup>, degradation by bacteria from creosote-contaminated marine sediments with nitrate- and sulfate-reducers, respectively, under anaerobic conditions in a fluidized bed reactor (Rockne & Strand 1998)

#### Biotransformation:

##### Bioconcentration, Uptake ( $k_1$ ) and Elimination ( $k_2$ ) Rate Constants or Half-Lives:

$k_1 = 6.79 \text{ h}^{-1}$ ;  $k_2 = 0.0155 \text{ h}^{-1}$  (trout muscle, Neely et al. 1974; Neely 1979)

$k_1 = 6.8 \text{ h}^{-1}$ ;  $1/k_2 = 65 \text{ h}$  (trout, quoted, Hawker & Connell 1985)

$\log k_1 = 2.21 \text{ d}^{-1}$ ;  $\log 1/k_2 = 0.43 \text{ d}$  (fish, Connell & Hawker 1988)

$\log k_2 = -0.43 \text{ d}^{-1}$  (fish, quoted, Thomann 1989)

#### Half-Lives in the Environment:

Air: calculated lifetime of ~3 d due to reaction with OH radical, assuming an average daytime atmospheric OH radical concn of  $\sim 1 \times 10^6$  molecule/cm<sup>3</sup> (Atkinson et al. 1984);

estimated atmospheric lifetime of ~2.7 d due to reaction with the OH radical for a 24-h average OH radical concn of  $5 \times 10^5 \text{ cm}^{-3}$  (Atkinson & Aschmann 1985);

calculated tropospheric lifetime of 9 d due to the rate constants of gas-phase reaction with OH radical (Atkinson 1987);

$t_{1/2} = 7.8\text{--}110 \text{ h}$ , based on photooxidation half-life in air (Howard et al. 1991);

tropospheric lifetime of 2.0 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for biphenyl (Kwok et al. 1995).

Surface water:  $t_{1/2} \sim 1.5 \text{ d}$  in river water (Bailey et al. 1983);

$t_{1/2} = 36\text{--}168 \text{ h}$ , based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991); photolysis  $t_{1/2} = 19.18 \text{ min}$  in aqueous solution when irradiated with a 500W medium pressure mercury lamp (Chen et al. 1996).

Groundwater:  $t_{1/2} = 72\text{--}336 \text{ h}$ , based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

#### Sediment:

Soil:  $t_{1/2} = 36\text{--}168 \text{ h}$ , based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biota: estimated  $t_{1/2} = 29 \text{ h}$  from fish in simulated ecosystem (Neely 1980).
